

SubDevice.AddEvent (works without a function)

Add an event. Events are an obligatory part of creating rules. This event works without a function

Синтаксис

```
SubDevice.AddEvent(Name, Path, ScriptCall, Compare, [Default],  
[AdvancedField])
```

Название	Пример	Описание
Name	"Temperature drops below..."	type: String Action name
Path	"Drivers.Nest.CurrentTemperature"	type: String Full path to a channel, driver feedback channel or token. It is subscription to keeping track of changes
ScriptCall	false	type: Boolean A feature of working via a function. In this realization set false
Compare		type: String Comparison operator as a string
Default	"23"	type: String Default value
AdvancedField		type: Object, Array It is used to work with complicated actions. If AdvancedField is used, set null in Default parameter. One object or a object array can be sent in AdvancedField.
