Device.GetFeedback()

to get the value from the feedback channel of the driver. The channel must be created in advance in Project Device Panel. It is used for getting access to data written in the channel.

Syntax

```
Module.GetDevice(driver).GetFeedback(name)
```

input	sample	description
driver	"Driver 1"	type: string the driver name in the iRidium project
name	"Channel 1"	type: string the feedback channel name (Feedbacks)
output		
value	"data"	type: string, number the string or number received from the feedback channel

Example:

```
B.getModule(ModuleID);
Module.GetDevice("MyDevice").GetFeedback("Value 1"); // 100
```
