

## List.SetDataFilter

{{API Function/ru |description=Add a filter by data |constructor= List.SetDataFilter(key, value)  
|input=

key	type: String name of any object field installed on a list item via ListItem.SetData <a href="#">ССЫЛКА</a>
value	type: Mixed value from this field

|output= - |JsSample=

```
var l_oList = module.GetPopup("Popup 1").GetItem("list"); //getting the list
object
var l_oItem_1 = l_oList.GetItemByIndex(1); // getting list items
var l_oItem_2 = l_oList.GetItemByIndex(2);
var l_oItem_3 = l_oList.GetItemByIndex(3);
//Setting data to each list item
l_oItem_1.SetData(
{
    type: "coffee",
    name: "test"
})
```
