IR.ModuleSetupFinish

{{API Function/ru |description=Completing module installation is required when developing a scanner. This method is used to develop a scanner to set a module for installation with all required data. |constructor= IR.ModuleSetupFinish(StoreID, ModuleData, [Callback]) |input=

StoreID	82	type: Number Module ID in the store
ModuleData		type: Object Data for module required for its work. Format to record data for module is given below

Callback	function(in_error){...}	type: Function
		Function that is performed after a module is installed.
		• in_error - the coming parameter that signals successful installation
		  - 0 - no errors
		  - 1 - installtion errors

|output= - |JSsample=

```
//An example of installing HDL Dimmer from the scanner
var l_nStoreID = 82;
var l_oModuleData = {
        Module: {
                //Data required for module work
                Type: "Dimmer",
                SubnetID: 3,
                DeviceID: 6
                Name: "HDL Dimmer"
        }
        Drivers: {
                //Data for driver
                "HDL-BUS Pro Network (UDP)": {
                   Host: "255.255.255.255", //setting  a host for the driver
                   Port: "6000" //setting a port for the driver
                },
        }
}
```
