

i3 lite project - an automation project made up of ready equipment control modules. i3 lite projects differ from i2 Control projects: i3 lite projects can be edited dynamically without prior editing in iRidium studio. i3 lite project consists of several small parts that can be put together into a single whole and easily edited in i3 lite app with the help of built-in constructor. A big number of intermediate processes, such as installing software on PC, uploading projects on control panels are no longer necessary. All is done in one place - on a control panel.
