

---

The role of tokens in the server module is performed by Virtual Tags. To add them: after adding the driver in the server module select "Virtual" in the iRidium Server driver, right-click on "Tags" and select "Add Virtual Tag". When creating the panel module the tags will be saved as Project Tokens. Also, as in the script of the static module, in the script of the panel module you need to describe when the panel module works and when the server one does.
