**Script development.**

Set up the scanner properties. It is recommended to create an array of "properties" object for that, for example:

```
var properties = [{
        "type": "textfield",
        "name": "Host"
    }, {
        "type": "textfield",
        "name": "Port"
    }, {
        "type": "textfield",
        "name": "Login"
    }];
```
